

ServiceNow AICT Integration with Tavro

1. Objective

The objective of this implementation is to integrate ServiceNow AI Control Tower (AICT) with the Tavro platform so that AI agents created in Tavro are automatically registered as AI Systems in AICT. The integration synchronizes agent metadata, such as name, description, and provider information, from Tavro to AICT.

2. Prerequisites

2.1 ServiceNow Instance

- A ServiceNow instance running the Australia Release.
- AI Control Tower (AICT) must be installed and upgraded to the latest supported version available for the Australia Release.
- Required AICT tables and APIs must be accessible from the integration user account.

2.2 ServiceNow Credentials

- A ServiceNow user with read/write access to:
 - core_company
 - cmdb_ai_system_component_product_model
 - alm_ai_system_digital_asset

2.3 Tavro Application

- Tavro source code running via Docker Compose
- .env file configured with AICT credentials

3. Integration Approach

The integration uses a backend synchronization architecture between Tavro and ServiceNow AI Control Tower (AICT).

Users begin by generating AI ideas through the Spark module in Tavro using the **Inspire Me** capability. When an idea is selected for development, Tavro creates an AI Use Case and automatically associates an AI Agent with that use case.

As part of the agent creation workflow, Tavro invokes ServiceNow AICT APIs to register the agent as an AI System in AICT. The integration currently synchronizes the following agent metadata:

- Agent Name
- Agent Description
- Provider Information

The synchronization is handled by the Tavro backend service, which communicates directly with ServiceNow AICT. This enables AI agents created within Tavro to be automatically represented in AICT for centralized visibility and governance.

The integration supports:

- Automatic AI Use Case creation from Spark-generated ideas.
- Automatic AI Agent creation and association with AI Use Cases.
- Registration of Tavro AI Agents as AI Systems in ServiceNow AICT.
- Synchronization of agent metadata, including name, description, and provider information.

4. Integration Steps

4.1 Generate an AI Idea

1. Navigate to **Spark** from the Tavro navigation menu.
2. Click **Inspire Me**.
3. Tavro generates one or more AI idea recommendations.
4. Select the desired idea and click **View & Develop**.

4.2 Create an AI Use Case and open associated AI Agent

1. The selected idea is converted into an AI Use Case.
2. Open the AI Use Case details page.
3. Navigate to the **AI Agents** tab.
4. Open the AI Agent associated with the AI Use Case.

Identification & Role

Executes the 'Commercial Loan Document Extraction and Classification' use case by analyzing process with no ai coverage signals, surfacing prioritized actions, and tracking outcomes.

ASSIGNED ROLE

-

SYSTEM INSTRUCTION

Monitor operational data relevant to Commercial Loan Document Extraction and Classification and identify high-priority events. Correlate findings with business context and produce actionable recommendations with rationale. Trigger alerts when confidence thresholds are met and persist decision traces for governance review. Escalate uncertain or high-impact cases to human owners and incorporate feedback in future runs.

4.3 Automatic AICT Registration

When the AI Agent is created, Tavro automatically sends the agent information to ServiceNow AI Control Tower (AICT).
