

ServiceNow AICT Inbound Integration with Tavro

1. Objective

The objective of this integration is to connect ServiceNow AI Control Tower (AICT) with Tavro so that AI governance assets defined in ServiceNow are automatically imported into the Tavro agent catalog. When the connector is run from the Tavro Admin Portal, it fetches AI systems and AI models from ServiceNow and upserts them as agents in Tavro — including their linked AI models, tools, instructions, and agent-to-agent relationships.

2. Prerequisites

2.1 ServiceNow Instance

- A ServiceNow instance running the **Australia release** with the AI Control Tower (AICT) plugin installed and activated.
- At least one AI system or AI model asset created and governed in AICT

2.2 ServiceNow Credentials

- A ServiceNow user account with read access to AICT assets
- Required AICT tables and APIs must be accessible from the integration user account.

2.3 Tavro Application

- Tavro source code cloned from the open-source repository
- Docker and Docker Compose installed
- Tavro Admin Portal accessible in a browser

3. Integration Approach

The integration uses Tavro's built-in connector framework. When Run Connector is clicked in the Admin Portal, the connector queries ServiceNow for all governed AI assets, determines whether each asset is an AI system or AI model, and imports it into Tavro accordingly.

AI systems are imported as full agents with name, description, version, provider, instruction, linked AI models, tools, and agent-to-agent relationships

AI models are imported as agent entries with name, description, version, and provider

Re-running the connector updates existing agents in place no duplicates are created.

4. Integration Steps

4.1 Clone the Tavro Repository

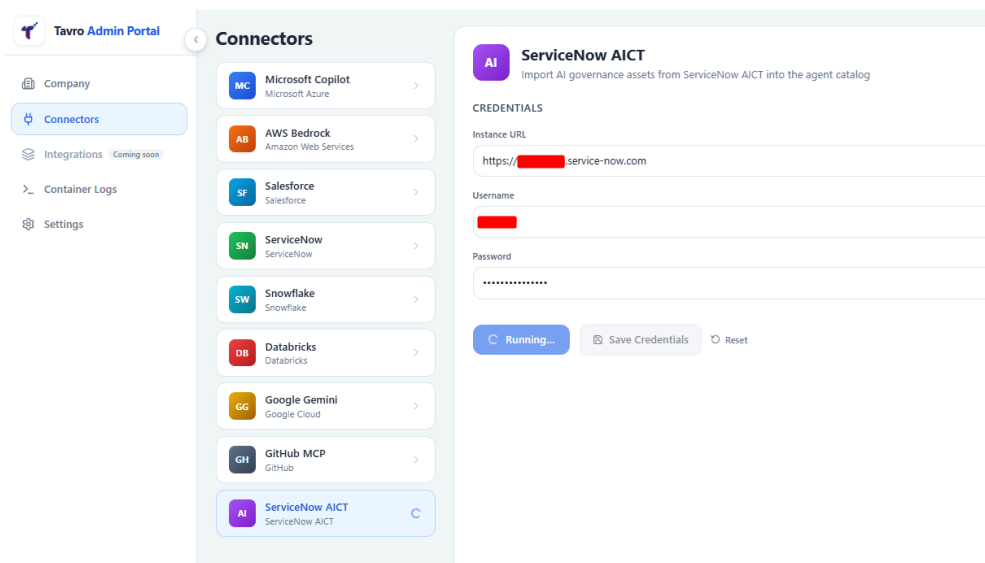

- Clone the Tavro source code from:
- git clone <https://github.com/TavroOrg/tavro.git>
- cd tavro

4.2 Start the Tavro Application

- docker compose up -d --build

4.3 Configure the Connector in the Admin Portal

- Open the Tavro Admin Portal and navigate to **Admin** → **Connectors**
- Find the **ServiceNow AICT** tile and click **Configure**
- Enter the following connection details:
 - **Instance URL** : `https://<instance-name>.service-now.com`
 - **Username**: <enter-username>
 - **Password**: <enter-password>
- Click Save

4.4 Run the Connector

Click Run Connector on the ServiceNow AICT tile. Once complete, navigate to the Agent Catalog to see the imported agents with their linked models, tools, and relationships.

4.6 Verify in the Agent Catalog

- Navigate to Agent Catalog in Tavro. The imported agents should appear with:
- Name, description, instruction, provider, version from ServiceNow AICT

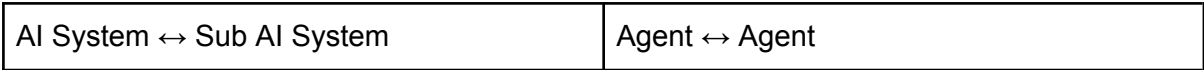

- Linked AI models visible on the business impact tab
- Tools listed under the agent
- Parent-child agent relationships reflected

5. Field Mapping

ServiceNow AICT Field	Tavro Field
AI System sys id	Agent Id
AI System name	Agent name
AI System description	Agent description
AI System version	Agent version
AI System provider	Provider organization
AI Prompt	Agent instruction
AI Model sys id	AI Model Id
AI Model name	AI Model name
AI Model description	AI Model description
AI Model version	AI Model version
AI Model provider	AI Model provider
AI Tool sys id	Tool Id
AI Tool name	Tool name
AI Tool description	AI Tool description

6. Relationship Mapping

ServiceNow AICT	Tavro
AI System ↔ AI Model	Agent ↔ AI Model
AI System ↔ Tool	Agent ↔ Tool

Imported AI System in the Tavro Agent Catalog Showing Agent Metadata (Agent ID, Name, Description, Instruction, Provider, and Version)

Identification & Role

Manages multilingual service settings and data policy configurations for Now Assist through conversational commands. Handles translation toggle operations (enable/disable Native Translation (NT), enable/disable Dynamic Translation(OTL), translation status inquiries, language configuration per model provider (view, add, remove languages for both Native and Dynamic Translation), data and policy configuration (privacy policies, data patterns, data sharing, data overflow processing / Azure Data Bursting / cloud bursting), and updating data sharing opt-out and data overflow processing opt-out configurations and answering help questions about Now Assist features and settings.

Trigger phrases include:

ASSIGNED ROLE

SYSTEM INSTRUCTION

THIS workflow manages multilingual service settings through a continuous multi-turn conversation. You are a router - your only jobs are: classify intent, route to agents, and keep the conversation alive until the user explicitly exits.

CRITICAL RULES:

1. ALWAYS route to an agent for category A, B, C and E. NEVER answer the user directly using FALLBACK, general knowledge, or previously observed agent results - even if you saw the answer in a TASK COMPLETION observation. The agent already showed the result to the user. You must route to the agent agents for every new request.

AGENT TO AGENT (3)

Data and Policy Configuration Agent

4ff1784a3b694f10a38f312c95e45a74

Manages Data and Policy configuration for Now Assist. Retrieves the list of privacy policies, data patterns, data sharing and Data overflow processing details and displays it to the user. Handles opt-in and opt-out requests for data sharing and data overflow processing (also known as Azure Data Bursting or cloud bursting). Requires user confirmation before making changes and validates Data Steward role. Answers questions related to Privacy policies, Data patterns, Data sharing and Data overflow processing. Provides clickable deep links for navigating to privacy section pages.

Remove

Language Configuration Agent

13f1b84a3b694f10a38f312c95e45a78

Handles language configuration for Now Assist multilingual service model providers. Retrieves the list of model providers and their configured languages, adds or removes languages for both Native Translation and Dynamic Translation per provider. Does NOT handle translation toggle operations (enable/disable) — that is managed by the Translation Settings Agent.

Child

Remove

Translation Settings Agent

a7e1b88a3b694f10a38f312c95e45a7d

Handles translation toggle operations and status inquiries for Now Assist multilingual services. Users may refer to Native Translation as "NT", and Dynamic Translation as "DT". Retrieves current Native Translation and Dynamic Translation states, enables or disables Native Translation, and enables or disables Dynamic Translation. Does NOT handle language configuration per provider — that is managed by the Language Configuration Agent.
